

GRASPOINTNER
Sustainable innovation.

Strength
when it's
needed most.

Safety channels
Slot channels

Drainage systems

Special systems for special applications.

Special challenges demand extraordinary strength. Our concrete safety and slot channels are therefore ideal for any location that is subject to heavy traffic and heavy loads such as:

- Airports
- Logistic centres
- Motorways
- Container terminals
- Ports, etc.

Extremely tough – but soft on the environment.

Like the brown bear, which is strong and robust but also a harmonious part of nature, our safety and slot channels combine a high level of performance with low environmental impact:

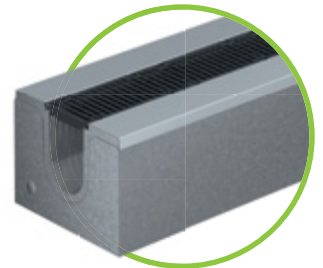

- Extremely efficient drainage performance
- Exceptionally robust and durable
- Mineral, cement-bound material
- 100% recyclable
- Environmental BG energy mix

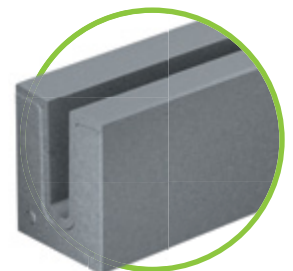

GRASPOINTNER
Sustainable innovation.

For serious work.

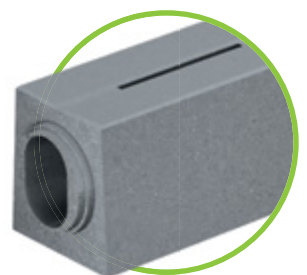

Regardless of what drives over them – a forklift truck or a cargo- or passenger plane – our channels are highly resilient and remain immovable in the truest sense of the word. High-quality construction materials and ingenious designs ensure that nothing wobbles or rattles, even when subjected to heavy-duty loads.

BG-SI safety channels

page 12-27

BG energy mix:

1.89%	Other green energy
8.48%	Wind energy
9.57%	Solid or liquid biomass
80.06%	Water power

Extremely **stable** and **safe.**

Vehicles and aircrafts are becoming heavier and traffic intensity is increasing all the time, presenting a growing challenge for the transport infrastructure – this is especially true at airports, motorways and container terminals. This trend is likely to continue, with no end in sight. The BG-SI safety channel has been specially developed to meet these challenges.

Exceptionally **robust.**

The channel has a solid concrete body with appropriate reinforcement and 4-times bolted ductile iron gratings. This makes it perfect for any locations with heavy vehicle movements where high mechanical stresses such as rotary, braking and shear forces can be expected.

Class F 900

All-around galvanised steel edge

- Fully integrated and 4 mm massive
- Channel body casing
- Sealed all-around edge protection

Sealable channel system

- Moulded safety seam on the front side
- Channel can be sealed at the full cross-section

Pre-formed spacer

- Pre-defined distance between elements
- Precisely engineered joints
- Simple, efficient installation

Extremely time-efficient

- Additional concrete casing is eliminated as this is a Type I channel in accordance with EN 1433
- No need to wait before laying the adjacent road surfaces

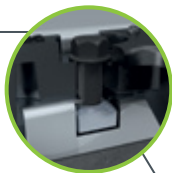

GRASPOINTNER
Sustainable innovation.

Bolted gratings made of ductile iron

- Safety bolts (4-times) for high stability
- Replaceable bolts for ease of maintenance
- Protection against longitudinal movement

Perfect fit

Flat edge surface for optimised one-level connection of the road surface

Anchoring brackets

The edge is anchored along the full length of the channel body.

Solid and durable

- Structural steel reinforcement
- Extremely stable, smooth side wall
- Expansion joint directly on the channel wall

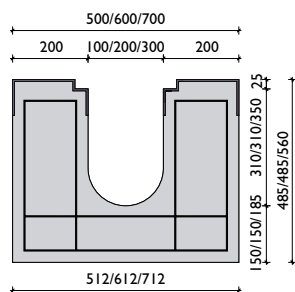

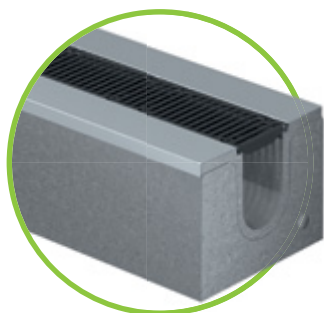

The benefits at a glance:

- Optimised for the most demanding applications
- easy handling, highly practical, reduced construction times
- Solid channel body up to load class F 900 kN (Type I in accordance with EN 1433)
- High-quality concrete with constructional reinforcement
- Solid steel edge affords all-around protection
- Bolted ductile-iron gratings with protection against longitudinal movement

BG-SI safety channels

Nominal width 100, 200, 300

with galvanised special edge

BG-SI safety channel, nominal width 100, 200, 300 - class F 900 kN

Channel body with special steel edge up to load class F, with bolted ductile iron gratings

Item no.	Channel body	Length	Width	Height	Weight
20100	BG-SI safety channel NW 100	2500	512	485	530 kg
20102	BG-SI safety channel NW 100	1000	512	485	530 kg
20300	BG-SI safety channel NW 200	2500	612	485	560 kg
20302	BG-SI safety channel NW 200	1000	612	485	560 kg
20400	BG-SI safety channel NW 300	2500	712	560	710 kg
20402	BG-SI safety channel NW 300	1000	712	560	710 kg

Gratings for BG-SI safety channel

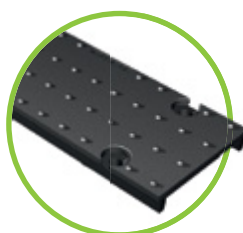

Item no.	Gratings incl. bolting material - M12	Load class	Pc./pallet	Weight
22057	BG-SI ductile iron grating NW 100, 500/147/25, SW 16/120	F 900 kN	120	5.4 kg
22058	BG-SI ductile iron grating NW 100, 500/147/25, closed cover	F 900 kN	120	7.7 kg
22076	BG-SI ductile iron grating NW 200, 500/247/25, SW 16/220	F 900 kN	60	11.1 kg
22077	BG-SI ductile iron grating NW 200, 500/247/25, closed cover	F 900 kN	60	16.8 kg
22096	BG-SI ductile iron grating NW 300, 500/347/25, SW 16/148	F 900 kN	30	30.9 kg

Accessories

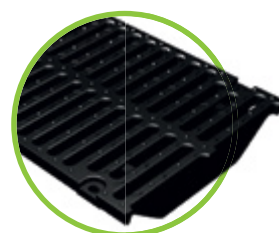

Item no.	Accessories	Length	Width	Height	Weight
20720	Sump unit for BG-SI safety channel NW 100	1000	500	1000	1,200 kg
20722	Sump unit for BG-SI safety channel NW 200	1000	600	1000	1,300 kg
20723	Sump unit for BG-SI safety channel NW 300	1000	700	1000	1,350 kg
20700	Front- or end cap for BG-SI safety channel NW 100		230	400	1.4 kg
20704	Front- or end cap for BG-SI safety channel NW 200		330	400	2.1 kg
20708	Front- or end cap for BG-SI safety channel NW 300		680	555	5.0 kg
20020	Corner for two channels with mitre (channel incl. grating)				

Ductile iron grating
SW 16/120, 16/220 - class F,
for NW 100 and 200

Ductile iron grating class F
closed cover
for NW 100 and 200

Ductile iron grating
SW 16/148 - class F
for NW 300

Special parts: **Won't fit - doesn't exist.**

The world isn't always smooth and straight – and motorways, runways and terminals are no exception. This is no problem for our safety and slot channels, as we offer a range of special parts, making installation simple even in particularly challenging situations.

T or cross pieces

Practical pre-fabricated components that can be installed with a minimum of time and effort. Complicated local junctions and intersections between two channel lines are eliminated.

Adapters

These accurate adapters are available in different lengths. They are individually manufactured to fit each channel line precisely.

Mitre piece

For installation in polygon shapes, we offer individually customised mitre pieces. Accurately cut channel bodies and gratings create clean, uniform joints on installation.

Accessories: for added strength.

Discover the accessories for our safety and slot channels. They are optimally matched to our channels and feature the same high quality.

Sump units

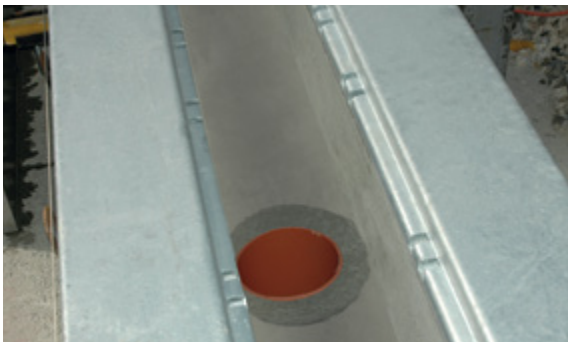

We offer a high-performance sump unit for every nominal width. The sided outlet is available with two different pipe fairleads: DN 150 (for NW 100) and DN 200 (for NW 200 and 300).

The sump unit is highly variable and can be installed at any position in the channel line.

Front caps

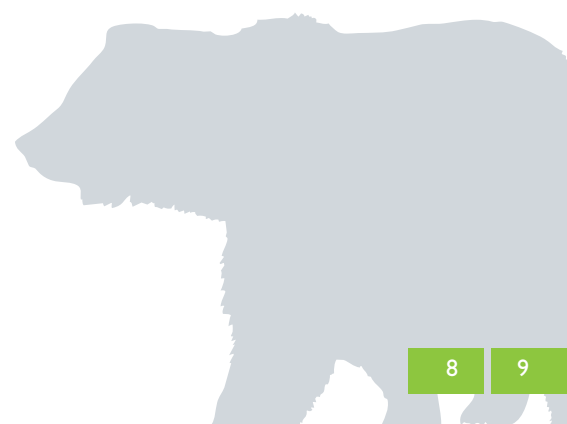

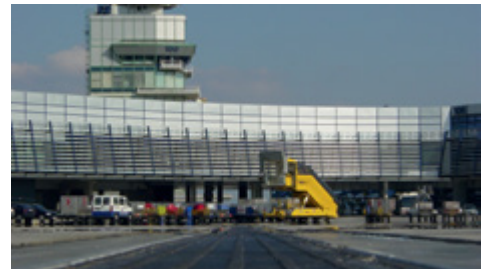

Our perfectly fitting front and end caps ensure tight closure of the channel line.

Bottom outlet

On request, we can also supply BG-SI safety channels with a 300/500 bottom outlet. This can be manufactured with base drainage to fit the nominal width including a pipe fairlead.

BG-SL slot channels

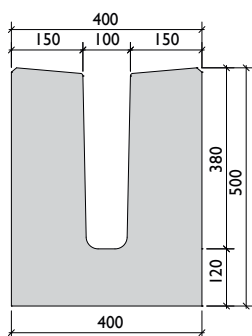

Profile U

BG-SL slot channel, profile U - class F 900 kN

Drainage channel without cover

Item no.	Channel body	Length	Width	Height	Weight
I 9000	BG-SL slot channel profile U, NW 100, L=2500 mm	2500	400	500	425 kg
I 9001	Additional charge for bottom outlet 600 x 80 mm				

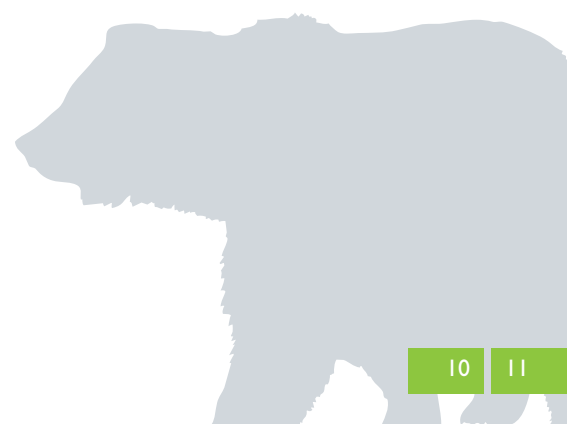

Accessories

Item no.	Accessories	Weight
I 9003	Front cap for BG-SL slot channel profile U, NW 100, galvanised	1.0 kg

The benefits at a glance:

- Separates the taxiway and runway from the green area
- Slot channel without cover - easy to clean
- Sloped top edges - for easier water collection
- Adapters allow installation in all radii

References

Highly **variable**, unique **expertise**.

A partnership that brings outstanding benefits. We manufacture our highly stable BG slot channels in cooperation with **CS-BETON** from the Czech Republic.

Strong in every situation.

Our highly versatile slot channels are an important feature in traffic engineering. They provide efficient drainage for the surfaces of:

- Highways
- Container terminals
- Industrial and port facilities
- Motorways and tunnels
- Logistics centres
- Aircraft movement areas

Silent and effective.

Despite their wide range of applications, BG slot channels perform extremely well in any situation. They are highly robust and they do not need a cover – as a result, they are maintenance-free and very quiet.

Class F 900

Compact connection of channel joints

A compact connection is achieved using the gaskets supplied, which must be installed on site. Tongue and groove system for each channel element.

Ideal flow characteristics

For surfaces without sufficient slope, BG slot channels can be supplied with a pre-installed inner slope of 0.5%.

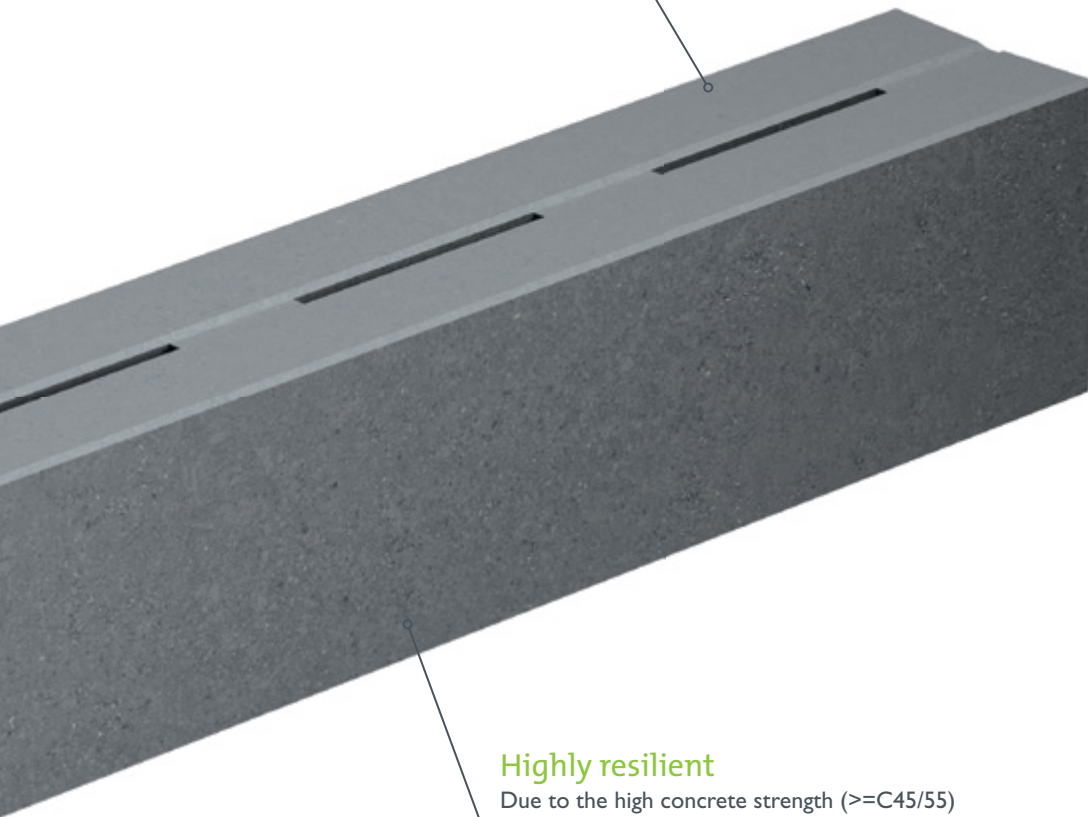

GRASPOINTNER
Sustainable innovation.

Unique slot geometry

- Suitable for all applications
- Interrupted, continuous or covered slot
- Also available with a border for installation at rising surfaces

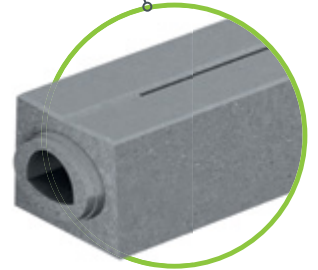

Optimum drainage performance

Optimum water collection thanks to 3% surface slope towards the slot.

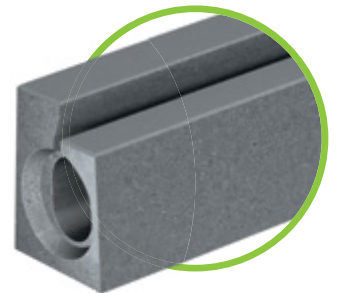

Highly resilient

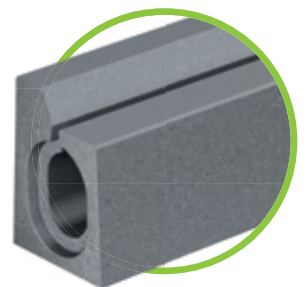

Due to the high concrete strength ($\geq C45/55$) incl. steel reinforcement bar.

BG slot channel with interrupted slot and small conduit

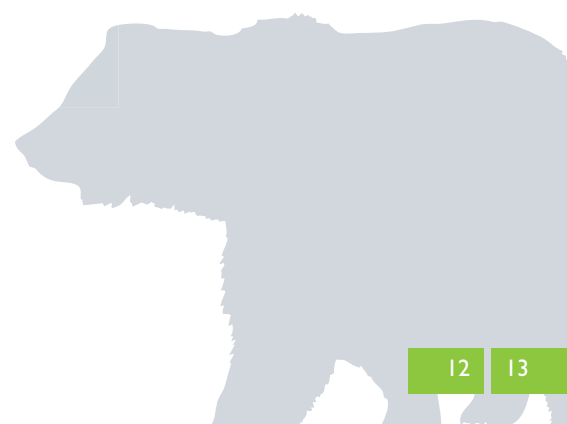

BG slot channel with covered slot and border

BG slot channel with continuous slot and border

The benefits at a glance:

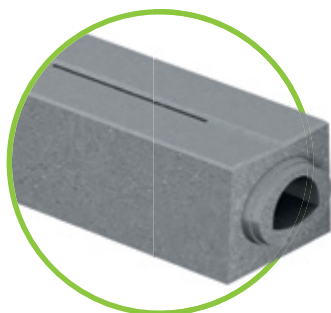

- Different channel profiles for a wide range of applications
- Highly resilient up to class D 400, E 600 or F 900 kN
- Very variable: option of 0.5% inner slope, with or without border, expansion joint directly on the channel body
- Element length 4000 mm — special lengths on request
- Manufacturer with decades of experience
- Produced and certified to EN 1433

Accessories

BG slot channels - a system of CS-Beton

Sump unit, bottom part (on shaft)

Sump unit, top part

Installed sump unit

Sump units

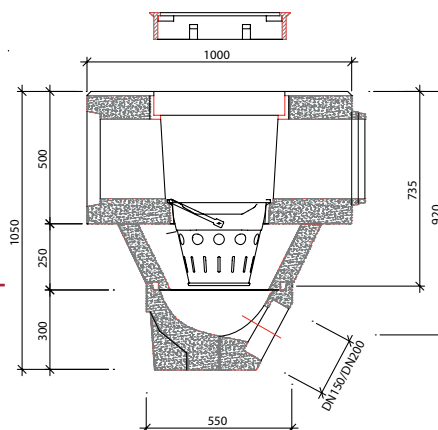

Sump units are manufactured with an element length of 1000 mm and supplied in 2 parts.

The bottom part must be laid first so that it will not twist or tilt, after that the top part with pre-formed outlet can be placed on it. The top part is available in 2 different designs: with a groove-groove or tongue-groove system depending on the connection options in the channel line. The ductile iron cover is securely bolted into the frame.

Installation detail for the sump unit

Sump unit incl.
sediment bucket
and cone

Shaft base
DN 150 or DN 200

Sediment bucket (integrated into sump unit)

A galvanised sediment bucket is included in the sales set. It is used to trap coarse dirt and can be cleaned at any time.

Front-/ end caps

Front caps (tongue) or end caps (groove) provide a clean and tight closure of the channel line.

Fire protection component

The fire protection component, with an element length of 2000 mm, is used to safely stop burning liquids (e.g. oil, fuel, etc.) in tunnel construction. The integral baffle ensures that liquid does not continue to burn in the channel line.

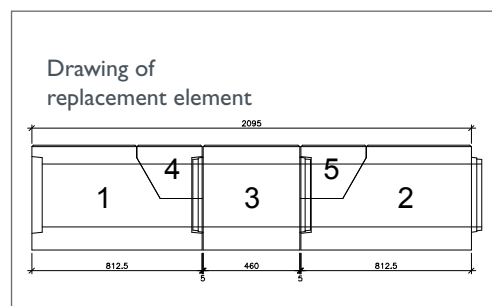

Curved element

The curved element can be used to lay channel components in a radius of 1 metre, from min. 7° to max. 45°. This flexibility makes installation much easier.

Replacement element / adapters

The replacement element set consists of 5 individual parts which allow easy replacement of damaged elements in an existing channel line. The "replacement part" (no. 3) can be supplied in a wide range of installation lengths, from a minimum of 2100 mm to a maximum of 4000 mm.

Cleaning element

The cleaning element is 1000 mm long and is available in 2 different systems: with a tongue-groove or tongue-tongue system, depending on connection options/position in the channel line. The ductile iron cover is bolted into the cleaning element and can be opened quickly and easily during cleaning work.

Lifting grabs

Installation can be carried out simply and effectively using the specially developed lifting grab.

BG-SI safety channels.

BG-SL slot channels.

Load class	A 15	B 125	C 250	D 400	E 600	F 900
Concrete quality - found. accor. Ö-Norm B4710-I*	C16/20	C20/25	C20/25	C25/30	C25/30	C25/30
Foundation width: X	>8 cm	>10 cm	>15 cm	>15 cm	>15 cm	>20 cm
Foundation height: Y						
BG-SI	Not required					
BG-SL	Minimum channel height -15 cm					
Foundation thickness: Z	>8 cm	>10 cm	>15 cm	>20 cm	>20 cm	>25 cm

*Concrete quality is a minimum requirement and must be adjusted to local conditions.

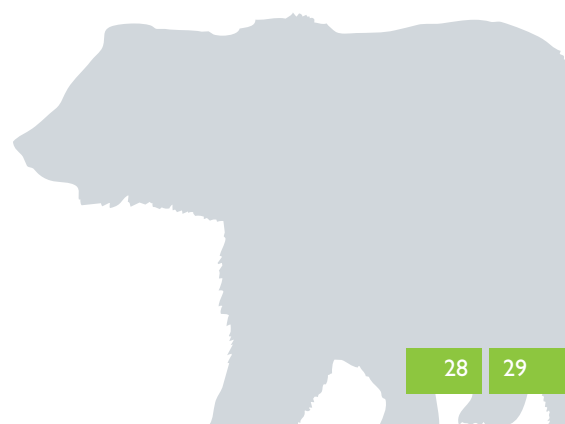

CAUTION: Impact, braking and rotary forces must be considered separately. Always follow the installation instructions. We reserve the right to make technical changes. Not suitable for installation across the carriageway in primary roads or motorways.

Further information can be found on our website www.graspoinetner.at or by contacting one of our technical engineers directly for installation conditions which differ from those described here.

Our installation guidelines and installation examples are generally accepted suggestions. Special types of installation must be defined by the planners on the basis of local conditions. The generally recognised technical rules and regulations must be observed during installation.

- 1 The load class (in accordance with EN 1433) and installation site must be appropriate for the local conditions.
- 2 Channels must be installed on mechanically compressed base layers or reinforced concrete slabs according to the project engineer's specifications. The drainage channels are lifted onto spacer blocks and grouted with high-strength mortar or laid on an earth-moist foundation. The channel elements must always be lifted using suitable tools (e.g. BG lifting grab).
- 3 A supporting wedge may be needed at the side, depending on structural requirements. Start laying the channel line at the junction to the outlet.
- 4 To ensure that the section is completely sealed, a moulded safety seam is already provided on the front of BG drainage channels. It determines the correct width and depth of the sealing joint and can be sealed with a suitable sealant. (See the guidelines for use of BG sealing systems). In addition, a moulded hemisphere is provided on the front to ensure the correct spacing between the individual channel elements in order to compensate for expansion stresses caused by temperature fluctuations.
- 5 When sealing the adjacent surfaces, always ensure that the channel elements are not exposed to any mechanical damage.
- 6 Any running joints needed between the BG drainage channels and the adjacent carriageway (to compensate for horizontal forces) can be provided directly on the channel element. In the adjacent concrete area, running joints which cross the channel line must be positioned so that they run through a channel joint.
- 7 All adjacent concrete surfaces should be permanently approx. 3 - 5 mm higher than the surface of the channels. The same installation guidelines also apply to sump units.
- 8 Ensure that the bolts in the gratings form a permanent, positive connection. The operator is responsible for regular maintenance and inspection!

Installation details

BG installation examples

BG slot channels - CS-Beton system

Standard applications:

The following installation guidelines and installation examples are intended for standard applications. The load class and the installation location must be adapted to the local conditions by the planners. The generally recognised technical rules and regulations must be observed.

EN 1433 includes an exception for the slot widths of slot channels which are installed in areas where the use of bicycles is not permitted. On surfaces where bicycles are permitted, slot channels with a slot width equal to 30 mm may only be installed so that the longitudinal axis of the slot lies at right angles, or a maximum of $\pm 45^\circ$, to the direction of travel.

Foundation:

- 1 BG slot channels should be laid as follows depending on the condition of the foundation and the load class:

Class D 400 kN Type I – no load-bearing foundation required. Channels are laid on a mechanically compressed base layer (= frost protection layer) and a blinding/levelling layer made of concrete.

Class F 900 kN, Type M – structurally calculated reinforced concrete foundation required according to project engineer's specifications. When laying a channel on the reinforced concrete foundation, the connection between channel and foundation must be established using a suitable volume-stable assembly or grouting mortar, at least 2 cm thick, with quality at least C 25/30. When using a grouting mortar, the slot channel must be positioned and aligned on appropriate spacers. When backfilling the channel, ensure that the channel is evenly inserted and continuously supported (avoid backfilling from one side).

Lifting tool:

- 2 BG slot channels must be unloaded and moved using suitable lifting tools which allow for even and precise lifting and lowering (e.g. truck-mounted crane, appropriate digger). The components must be suspended centrally. Lifting tools available on loan from BG.
- 3 First the lower part of the lifting tool is lowered into the channel slot and turned through 90° to ensure that it is protected against rotation in the slot. Then the lifting device of the crane or digger can be hooked onto the lifting tool and the channel can be lifted easily and safely.

Butt joints and sealing:

- 4 Ensure that the first channel in the line is precisely positioned. During laying, the surfaces must be precisely aligned.
- 5 Before joining the elements together, clean the socket and fit the gasket on the spigot end. Apply the lubricant supplied evenly to the gasket and the sealing surface of the socket.
- 6 The slot channel suspended from the lifting tool must then be moved to the channel that has already been laid, until the gasket is evenly covered and the parts can be securely pushed together. The width of the butt joint must permanently be min. 5 mm to max. 15 mm. For uniform joints, we recommend using aids such as wooden slats with a thickness of around 10 mm.

BG installation examples

BG slot channels - CS-Beton system

Covering surfaces and expansion joints:

- 7 The road surface connection (asphalt, concrete, etc.) must be installed according to the planning specifications. When connecting concrete surfaces, sufficiently large dilation joints (expansion joints) must be provided along the channel so that no temperature-related expansion forces affect the sides of the channel. A continuous, suitable polystyrene plate or a bituminous softboard plate must be installed along the longitudinal joint between the channel and concrete cover over the full height of the channel. These plates must be capable of absorbing the expansion forces of the concrete cover and may not transfer/dissipate the horizontal forces of the concrete cover onto the channel.

IMPORTANT! Contractors must ensure that there is no rigid connection between the adjacent road surface (foundation, base layer, cover) and the channel.

- 8 All adjacent surface layers must permanently run at least at the same level as the channel surface in order to avoid mechanical damage (e.g. snow clearing) and in order to ensure proper water drainage.

- 9 Following completion of the adjacent surfaces, the longitudinal and transverse joints of the channels must be filled with a non-shrink sealant. Always ensure that the transverse joints between the individual channel units are permanently formed so that minor, temperature-related longitudinal movements of the slot channels can be absorbed. In order to avoid spalling, the slot channels must not be driven on during the construction phase. When working with machines and vehicles, ensure that the channels are not damaged.

Further information can be found on our website or by contacting one of our technical engineers directly.
